

# Kodi repository

Download the creator script:

```
wget
https://raw.githubusercontent.com/chadparry/kodi-repository.chad.parry.org/master/tools/create_repository.py && chmod +x create_repository.py
```

Run the script, and pass it the location of your add-ons. The location can be a local folder, a local ZIP file, or a Git repository URL.

Create REPO:

```
./create_repository.py --datadir kodi-repo --compressed
~/kodi/addons/context.youtube.dl.menu ~/kodi/addons/repository.anontester
```

Every time you update an add-on, run the script again.

```
git clone https://github.com/AnonTester/kodi-repo.git
cd kodi-repo
git config --global user.name "AnonTester"
#store credentials for this particular repository
git config credential.helper store
git commit --amend --reset-author
git push
```

Store git password on local machine

~/netrc and it won't ask for your username/password:

```
machine github.com
  login xxx
  password xxx
```

Process after each code adjustment:

```
cd ~
./create_repository.py --datadir kodi-repo --compressed
~/kodi/addons/context.youtube.dl.menu ~/kodi/addons/repository.anontester
cd ~/kodi-repo
git add .
git commit
git push
```

Repo zip file:

```
wget
https://github.com/AnonTester/kodi-repo/raw/master/repository.anontester/repository.anontester-1.0.0.zip
```
