# Mono

```
sudo apt install gnupg ca-certificates
sudo apt-key adv --keyserver hkp://keyserver.ubuntu.com:80 --recv-keys
3FA7E0328081BFF6A14DA29AA6A19B38D3D831EF
echo "deb [arch=amd64] https://download.mono-project.com/repo/ubuntu stable-
focal main" | sudo tee /etc/apt/sources.list.d/mono-official-stable.list
sudo apt update

sudo apt install mono-devel
```

Notes:

```
The package mono-devel should be installed to compile code.

The package mono-complete should be installed to install everything - this
should cover most cases of "assembly not found" errors.

The package mono-dbg should be installed to get debugging symbols for
framework libraries - allowing you to get line numbers in stack traces.

The package referenceassemblies-pcl should be installed for PCL compilation
support - this will resolve most cases of "Framework not installed:
.NETPortable" errors during software compilation.

The package ca-certificates-mono should be installed to get SSL certificates
for HTTPS connections. Install this package if you run into trouble making
HTTPS connections.

The package mono-xsp4 should be installed for running ASP.NET applications.
```
